

Enterprise Operations & Employee Handbook

Sample document for Production RAG practice

Purpose and Scope

This fictional enterprise handbook contains employee policies, cloud engineering practices, security requirements, and operational guidelines. It is designed for production RAG practice.

Annual Leave Policy

Full-time employees are entitled to 24 working days of annual leave per calendar year. Leave requests should normally be submitted at least five working days in advance. Unused leave may be carried forward up to a maximum of 10 days, subject to local policy.

Remote Work Policy

Eligible employees may work remotely up to two days per week with manager approval. Employees handling confidential customer data must use approved corporate devices and connect through the company VPN when accessing internal systems remotely.

Information Security

Passwords must not be shared. Multi-factor authentication is required for production systems. Sensitive documents must be stored only in approved repositories. Suspected data exposure must be reported within one hour.

Cloud Cost Optimization

Engineering teams should review cloud spending monthly. Recommended practices include rightsizing virtual machines, enabling automatic scaling for variable workloads, shutting down unused non-production resources, and purchasing reserved capacity for predictable long-running workloads.

Production Monitoring

Production services must expose health checks and generate structured logs. Critical failures should trigger alerts. Teams should monitor latency, error rate, availability, and resource utilization.

Data Retention

Operational logs are retained for 90 days unless regulation or contract requires longer retention. Customer data must follow product and regional retention requirements.

Access Control

Enterprise access follows the principle of least privilege. Employees receive only permissions necessary for their role. Sensitive production access requires approval and periodic access reviews.

AI and Knowledge Systems

AI assistants using internal documents must retrieve information only from sources the requesting user is authorized to access. Responses should provide source references when possible. Systems must be evaluated for incorrect retrieval, unsupported answers, prompt injection, and accidental exposure of confidential information.

Incident Response

For a critical production incident, the on-call engineer should acknowledge the alert, assess customer impact, and begin mitigation. After restoration, the team conducts a review and tracks corrective actions.
